dnaK-type molecular chaperone - chicken
N;Alternate names: heat shock protein 70
C;Species: Gallus gallus (chicken)
C;Accession: A25646
C;Accession: A25646
R;Morimoto, R.I.; Hunt, C.; Huang, S.Y.; Berg, K.L.; Baherji, S.S.
J. Biol. Chem. 261, 12692-12699, 1986
A;Title: Organization, nucleotide sequence, and transcription of the chicken HSI
A;Reterence number: A25646; MOID:86304452
A;Accession: A25646
A;Molecule type: DNA
A;Residues: 1-534 <MOR>
A;Residues: 1-534 <MOR>
A;Cross-references: GB:J02579; NID:9211940; PIDN:AAA48825.1; PID:9211941
A;Note: the authors translated the codon TCG for residue 583 as Trp
C;Function:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R:Eddy, R.J.; Sauterer, R.A.; Condeelis, J.S.

HEAT SHOCK 70 KDA PROTEIN 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PREEXISTENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING OF NEMLY TRANSLATED POLYPERTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANELLES. THE HSP70S IN MITOCHONDRIA AND THE ENDOPLASMIC RETICULUM PLAY AN ADDITIONAL ROLE BY PROVIDING A DRIVING FORCE FOR PROTEIN TRANSLOCATION THEY ARE INVOLVED IN SIGNAL TRANSDUCTION PATHWAYS IN COOPERATION WITH HSP90. THEY PARTICIPATE IN ALL THESE CONFORMATIONS OF OTHER PROTEINS. THEY PARTICIPATE IN ALL THESE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PRETIDE SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES STRESS-INDUCED DAMAGE.

1- INDUCTION: BY HEAT SHOCK.

1- SIMILARITY: BELONGS TO THE HEAT SHOCK PROTEIN 70 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. Submitted (SEP-1994) to the SWISS-PROT data bank.
-!- FUNCTION: SSA2 MAY PLAY A ROLE IN THE TRANSPORT OF POLYPEPTIDES BOTH ACROSS THE MITOCHONDRIAL MEMBRANES AND INTO THE ENDOPLASMATIC RETICULUM. A FUNCTIONAL DIFFERENCE BETWEEN YEAST SSA1 AND SSA2 PROTEINS IS EXPECTED. SSA2 CAN PARTICIPATE IN THE ATP-DEPENDENT DISASSEMBLY OF CLATHRIN-COATED VESICLES.

J. Biol. Chem. 268:23267-23274(1993).
II FUNCTION: AFFECTS ACTIN POLYMERIZATION THROUGH INTERACTION WITH THE ACTIN BINDING PROTEIN CAP32/34, ACTS AS A CHAPERONE BY STIMULATING THE REPOLDING OF DENATURATED CAP32 AND CAP34.
STIMULATING THE REPOLDING OF DENATURATED CAP32.
II SUBCELLULAR LOCATION: CYTOPLASMIC. FOUND IN F-ACTIN-RICH REGIONS OF THE CELL CORTEX AND CELL PROTRUSIONS.
II SUBCELLULAR STAGE: HEAT SHOCK COGNATE PROTEINS ARE EXPRESSED CONSTITUTIVELY DURING NORMAL DEVELOPMENT.
IN STATILARITY: BELONGS TO THE HEAT SHOCK PROTEIN 70 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. THE HSP70S IN MITOCHONDRIA AND THE ENDOPLASMIC RETICULUM PLAY AN ADDITIONAL ROLE BY PROVIDING A DRIVING FORCE FOR PROTEIN TRANSLOCATION. THEY ARE INVOLVED IN SIGNAL TRANSDUCTION PATHWAYS IN COOPERATION WITH HSP90. THEY PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABLILITY TO RECOGNIZE NONNATIVE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PEPTIDE SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURKING TRANSLATION AND MEMBRANE TRANSLOCATION, OR FOLLOWING

                                                                                                                                                                                                                                                                                                                                                      PUNCTION: IN COOPERATION WITH OTHER CHAPERONES, HSP70S STABILIZE PREEXISTENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING OF NEWLY TRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANELLES. THESE CHAPERONES PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABILITY TO RECOGNIZE NONNATIVE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PEPTIDE SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURING TRANSLATION AND MEMBRANE TRANSLOCATION, OR FOLLOWING STRESS-INDUCED DAMAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                s SWISS-PROT entry is copyright. Volpe T., Warner J.R., McLaughlin C.S.;
Submitted (SEP-1994) to the SWISS-PROT data bank.

-I- FUNCTION: SSA1 MAY PLAY A ROLE IN THE TRANSPORT OF POLYPEPTIDES
BOTH ACROSS THE MITOCHONDRIAL MEMBRANES AND INTO THE
ENDOPLASMATIC RETICULUM. A FUNCTIONAL DIFFERENCE BETWEEN YEAST
SSA1 AND SSA2 PROTEINS IS EXPECTED. SSA1 CAN PARTICIPATE IN THE
ATP-DEPRUBENT DISASSEMBLY OF CLATHRIN-COATED VESICLES.
-I- SUBCELLULAR LOCATION: CYTOPLASMIC.
-I- SIMILARITY: BELONGS TO THE HEAT SHOCK PROTEIN 70 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Protein expression during exponential Saccharomyces cerevisiae.";
